

Regeneration of a Lingual Moat with Interproximal Crater

The patient presented with a lingual moat on #20 and an interproximal crater between 19 and 20.

Day of surgery after grafting with [Immediate Graft™](#) mixed with [OsseoConduct™](#) β TCP Perio granules. The surgery performed was the Inverted Periosteal Graft.

Result: Six weeks after surgery the lesion is regenerated, the gingiva is healthy with normal probing.
